GOAL Shrimp Production Survey: Recovery coming

4 January 2016

By James L. Anderson, Ph.D. , Diego Valderrama, Ph.D. and Darryl Jory, Ph.D.

Report forecasts global production rebound through 2017

Green, head-off shrimp like these accounted for 39 percent in the most recent poll, significantly up from about 25 percent of production in the 2008 survey.

The Global Aquaculture Alliance's GOAL 2015 survey of production trends in shrimp farming polled 38 respondents from Asia/Oceania, 31 from Latin America and two from Africa. Figure 1 summarizes the production estimates for global production during 2007-2017, which combine data from the United Nations Food and Agriculture Organization (FAO) and both 2014 and 2015 GOAL (Global Outlook for Aquaculture Leadership) surveys.

Respondents in the 2014 survey reported substantial production declines during 2012-2013 in China, Thailand, Vietnam and Mexico as a consequence of the Early Mortality Syndrome (EMS) disease that originated in China in 2009. Surging shrimp prices in international markets during 2013 were consistent with industry expectations of declining production. Nevertheless, the most recent FAO data show China's production increasing 9 percent in 2012 and remaining stable in 2013. In the case of Mexico, FAO reported a 20 percent increase in 2013 even though production had contracted by half, according to industry reports. FAO data for Vietnam and Indonesia also seem to underestimate the impact of the global disease. Given these discrepancies, data for China, Vietnam, Indonesia and Mexico for 2012-2013 were obtained from the 2014 GOAL survey; data from 2007 through 2011 correspond to FAO while estimates for 2014-2017 were obtained from the 2015 GOAL survey. Discrepancies between FAO data and industry reports may narrow in the future as national governments and FAO revise their production statistics.

According to FAO, global shrimp farming production reached 4.2 million metric tons (MMT) in 2011 and then increased to 4.3 MMT in 2012 (up 3.5 percent) and 4.5 MMT in 2013 (up 2.7 percent). In contrast, the GOAL survey indicates that global production fell to 4.0 mmt in 2012 (down 3.5 percent) and further down to 3.6 mmt (down 11.1 percent) for an overall decline of 14 percent between 2011 and 2013 (Figure 1). According to GOAL statistics, there was a strong rebound in 2014 (up 21 percent to 4.3 MMT) with a minor decrease expected in 2015 (down 2.4 percent) and recovery taking place again in 2016 and 2017 at an approximate annual rate of growth of 7 percent. Global production is expected to reach around 4.8 MMT in 2017, barring a new disease crisis.

Asia production

Shrimp production grew steadily in east Asia through 2011, averaging a 6 percent annual growth rate from 2007 to 2011. The GOAL surveys indicate that production declined to 3.4 MMT in 2012 (down 5 percent) and 3.0 MMT in 2013 (down 13 percent) due to the impact of EMS in China, Thailand, Vietnam and Malaysia (Figure 2). Production increased substantially in 2014 to 3.7 MMT (up 24 percent) mostly due to the large harvests reported in Indonesia, Vietnam and India. The most remarkable growth through 2017 is expected in Indonesia, with production reaching 850,000 MT (24 percent annual growth rate between 2013 and 2017). India is also expected to see significant growth through 2017, from 290,000 MT in 2013 to 430,000 MT. Although Vietnam reported a large harvest in 2014 (669,000 MT), production was expected to decline in 2015 as a result of diseases and adjustments to lower shrimp prices, with only a partial recovery following through 2017.

Figure 3. Shrimp aquaculture production in major farming nations in Latin America. Sources: FAO (2010-2013) and GOAL Surveys (2013-2017).

Figure 3

An uneven recovery from EMS is expected in China: While the nadir was apparently reached in 2013 at 1.3 MMT, production was still impacted by diseases and extreme weather events in 2015. Output is expected to reach 1.5 MMT in 2017. On the other hand, Thailand was still reporting falling harvests by 2014, from 611,000 MT in 2011 to 217,000 MT (a 65 percent decline in three years). A partial recovery is expected by 2017. Thailand was for many years the second-most important regional producer, but seems destined now to lag behind China, Indonesia, Vietnam and India.

Most Asian and Latin American respondents expect global economic conditions to either improve or remain stable in 2016; most respondents also expect the global shrimp market to strengthen in 2016. Upward pressure on feed prices is nevertheless expected to continue in 2016.

In conclusion, the industry in Asia seems to be on the path of recovery following the substantial production declines in 2012 and 2013 caused by EMS. Production peaked at 3.6 MMT in 2011 but may reach 4.0 MMT by 2017, driven primarily by substantial growth in Indonesia, which has emerged relatively unscathed from the EMS crisis. Other countries in the region will also grow but their contribution will be more uneven. Of course, these estimates rely on the assumption that no major disease will break out in the region in the next few years.

As farmers learn to better manage shrimp diseases, old and new, and production technology improves, global production is growing again.

Latin America

Figure 3 presents estimates for the major producing nations in Latin America. Besides Asian countries, Mexico was heavily impacted by EMS in 2013: Respondents reported a 48 percent decline in production, from 100,000 MT in 2012 to 52,000 mt in 2013. Output recovered slightly in 2014 and further increases are expected by 2017, with production reaching nearly 100,000 MT. Still, this output falls short from the 130,000 MT harvested in 2008.

With notable exceptions such as Costa Rica and Colombia, most countries in the region expect to grow in the near future. The most remarkable growth is predicted for Ecuador, where production will increase from 300,000 MT in 2013 to 370,000 MT in 2017. Ecuador is increasingly targeting European and Asian markets in response to declining exports from Southeast Asia. Brazil is expected to reach 85,000 MT by 2017 while Honduras, Nicaragua and Venezuela should approach 30,000 MT. FAO reported an output of nearly 50,000 mt for Honduras in 2013 but production declined in 2014 due to the impact of droughts. In general, the region is expected to grow 5.5 percent annually from 2013 to 2017.

Product form trends

The GOAL survey also collects information on trends in size categories and product forms. A recent and notable trend in Asia is the increase of green shrimp relative to other product forms such as cooked and breaded. While head-on and head-off green shrimp accounted for only 25 percent of production in the 2008 survey, it accounted for 39 percent in the most recent poll. These changes may signal the growing importance of the domestic Chinese market, which has a preference for green shrimp over other processed forms.

The Pacific white shrimp (*Litopenaeus vannamei*) comprises about 40 percent of total global shrimp production (fisheries and aquaculture), despite supplies coming almost exclusively from farming activities.

Production in Latin America continues to be oriented towards green shrimp. Head-on shrimp has become the dominant product form. It accounted for an estimated 53 percent of production in 2007 but only 24 percent in 2014. Increased shipments of Ecuadoran shrimp to European and Asian markets are an important factor driving this trend.

Respondents in Asia have reported a move towards production of smaller shrimp sizes (51-60 and smaller) since 2010. The share of small counts increased from 27 percent to 49 percent between 2010 and 2014. The shift to smaller shrimp seems to have been driven by narrowing price margins between the small sizes and the larger counts. Early harvests caused by EMS and other factors also help explain this trend.

Disease impacts

“Diseases” was once again identified by survey respondents as the top challenge faced by the industry. Other disease-related issues such as “Seed Stock Quality and Availability” and “Access to Disease-Free Broodstock” were also ranked as major concerns – in the fourth and sixth positions, respectively. Given the recent decline in prices, “International Market Prices” re-emerged as the second most important issue for the industry. “Feed Costs” ranked as the third most important issue.

Perceptions on diseases have changed remarkably over the last eight years. In the 2007 survey, “Diseases” did not make it among the top three challenges for either Asian or Latin American producers, who used to be more concerned about feed costs, market prices and trade barriers. Disease issues have moved to the forefront since the onset of EMS.

Most Asian and Latin American respondents expect global economic conditions to either improve or remain stable in 2016; most respondents also expect the global shrimp market to strengthen in 2016. Upward pressure on feed prices is nevertheless expected to continue in 2016.
